Vocalizations of European Honey Buzzards *Pernis apivorus* in southern Africa

Andy Branfield

Abstract

Contrary to some sources, the European Honey Buzzard *Pernis apivorus* is not silent in Africa. This study documents 41 instances of the species vocalizing on the continent, mainly from southern Africa. Thirty instances involved single birds and 11 involved two European Honey Buzzards together. Vocalizations were recorded equally in adults and juveniles. More females were recorded calling than males but females are known to greater outnumber males in southern Africa. All calling males were accompanied by another European Honey Buzzard. Twenty-two instances involved birds calling in flight, 12 of birds perched and one instance (of two juveniles together) involved birds calling both in flight and when perched. Thirty-four instances involved the typical flight (contact) call and seven were judged as alarm calls. All instances involving two birds together involved flight calls. Of the seven instances of alarm calls, four were associated with the presence of other raptors and two with drongos. The birds appeared to call especially in late summer: 22 instances from December onwards and only ten before December. Calling associated with two birds together and accompanied by aerial displays has not been described in Africa before and may be suggestive of either early pairing of the adult birds prior to migration or breeding activity locally in Africa. Vocalizations involving young birds though may be more social as opposed to sexual in nature. The large increase in records of European Honey Buzzards in South Africa in recent years, if this represents an increase in the abundance of the species in the region, likely increases the chances of conspecific interaction and hence calling. It also raises the possibility of breeding, especially in more-temperate South Africa.

Keywords: European Honey Buzzard, *Pernis apivorus*, vocalizations, Africa

Introduction

Most popular sources describe the European Honey Buzzard *Pernis apivorus* as being silent in Africa (Brown 1982, Brown et al. 1982, Steyn 1985, Kemp and Kemp 1998, Hockey et al. 2005, Newman and Newman 2010, Sinclair and Ryan 2010, Oberprieler 2012, Chittenden et al. 2016). A few though state it to be largely silent (Clark and Davies 2018; Sinclair et al. 2020). Most sources do not even describe the call of the species.

The calls of nesting birds on their Palearctic breeding grounds are reported as a mournful whistle 'glee to', 'glee-ah' or 'glee-oo', alternatively a long-drawn 'glee-whoooo' or multi-syllabled 'goo-glee-ee-ee-oo'. (Gensbol 1984, Ferguson-Lees and Christie 2001, Svenson 2009, Beaman and Madge 2010, Vinicombe et al. 2014). These calls are given in flight and when perched, as contact calls between pair-members. The length, strength and pitch of the calls vary with emotional state. These calls are also uttered in the face of intruding raptors and during human disturbance at nests. The long, drawn out call is included in two southern African digital apps: Gibbon (2011) and Sinclair et al. 2020, e.g. the former presents a recording of an adult bird in flight, Pafuri, Kruger National Park.

This study documents instances of vocalization by European Honey Buzzards on their African wintering grounds, largely

by canvassing observations from observers familiar with the species.

Methods

I asked a wide diversity of observers whether they had heard European Honey Buzzards calling in Africa. Most were based in southern Africa, but some had experience of the species in other parts of Africa. I circulated my query via various digital internet resources, including by email, SMS, Facebook Messenger, Facebook and WhatsApp. Some individuals in turn posted my query on additional digital platforms. I used Google as another search method using the keywords 'European Honey Buzzard, Africa, voice, vocals, calls'. I also searched for video clips and sound clips on YouTube. Some individuals who are noted researchers on the species were contacted directly. I contacted a number of leading raptor researchers listed by the Global Raptor Information Network (GRIN; www.globalraptors.org), and also reached out to other experts who were not listed but who I know personally.

Results

I received 70 responses of which 41 involved instances of calling by European Honey Buzzards in Africa (Appendix 1) and 29 were from observers who had observed the species but without having heard any vocalizations (see Acknowledgements). Of the instances of European Honey Buzzards

vocalizing, six had videos accompanying the observation, five had digital sound recordings, 13 had photos, and the remaining 24 records had no such additional material (Appendix 1). Thirty-five instances came from South Africa (Gauteng - 16, Mpumalanga - 7, Western Cape - 5, Limpopo - 4, KZN - 2 and Free State - 1), three from Namibia, and one each from Zimbabwe, Angola and Ghana.

Of the 41 instances of calling, 30 involved single birds and 11 involved two European Honey Buzzards together (Appendix 1). Where calling involved two birds together it was not determined whether the calling came from one or both birds and this uncertainty is reflected in the numbers presented below.

Where the age of the birds was recorded, vocalizations were recorded equally in adults and juveniles, i.e. five adults and five juveniles were heard calling where single birds were involved, and where two birds together were involved, two involved two adults, two involved two juveniles and one involved an adult and a juvenile. Females form more than 90% of the South African population (Howes et al. 2019) and this was borne out by 6-7 females being recorded calling but only 1-3 males. All calling males were accompanied by another European Honey Buzzard. Where such information was recorded, 22 of the 41 instances involved birds

calling in flight, 12 of birds perched and one instance (of two juveniles together) involved birds calling both in flight and when perched. Of the 41 instances, 34 involved the typical flight (contact) call and seven were judged as alarm calls. All instances involving two birds together involved flight calls. Of the seven instances of alarm calls, four were associated with the presence of other raptors (including Western Osprey *Pandion haliaetus*, Black-winged Kite *Elanus caeruleus* and Ovambo Sparrowhawk *Accipiter ovampensis*) and two with Fork-tailed Drongos *Dicrurus adsimilis*. The birds appeared to call especially in late summer: 22 instances from December onwards and only ten before December.

Figure 1a and 1b shows photographs of two calling European Honey Buzzards engaged in typical aerial display and calling behavior. The photographs were taken by Richard McKibbin on 7 January 2020 at Zimbali Coastal Resort, Ballito, KZN, South Africa. This combination of calling and flying raises the possibility of this species breeding in South Africa. However, the bird on the right of both photos would appear to be an adult male, as evidenced by its greyish head and dark-tipped primaries, and the bird on the left a juvenile, possibly a male, as suggested by its streaked underparts, dark secondaries and wide dark tips to the outer primaries (sex and age details drawn from Ferguson-Lees and Christie 2001).

Figure 1a. Two adult European Honey Buzzards calling in flight (Photo: Richard McKibbin).

Figure 1b. The same two adult European Honey Buzzards as shown in Figure 1a calling in flight (Photo: Richard McKibbin).

Discussion

There has been a roughly five-fold increase in records of the European Honey Buzzard in South Africa between the first and second Southern African Bird Atlas projects (Howes et al. 2019; Figure 2; see: www.sabap2.adu.org.za).

The results of this largely southern Africa survey show that the European Honey Buzzard is not silent in Africa. It is not a very vocal species outside of its breeding grounds but it can be quite vocal at times, especially when apparently stressed or when another European Honey Buzzard is nearby. Calling has been recorded when two birds are present and when birds are seemingly alone. Calling does not seem to be associated with any specific sex or age. It has been heard calling in flight and when perched.

The reasons for calling while not breeding are probably varied and include alarm, conspecific interaction, and possibly

territoriality (supported by display flights and vocalization in flight). It has been recorded calling in social interactions with other European Honey Buzzards and in alarm.

Rob Bijlsma and Rob Simmons independently suggested that vocal interactions may represent attempts at breeding. At least 27% of vocalisations were apparently aimed at conspecifics (11 of 41 instances) and it is possible that some of the vocalizations heard from apparently solitary birds were actually aimed at conspecifics not visible to the observers. Most calls were given in flight, behaviour typical of flight displays recorded while breeding in the northern hemisphere. However, the situation shown in Fig. 1, where an apparent adult male is shown in a vocal and display interaction with a juvenile (and possibly a male juvenile) would not be congruent with breeding and is an example perhaps of how such interactions could be misinterpreted.

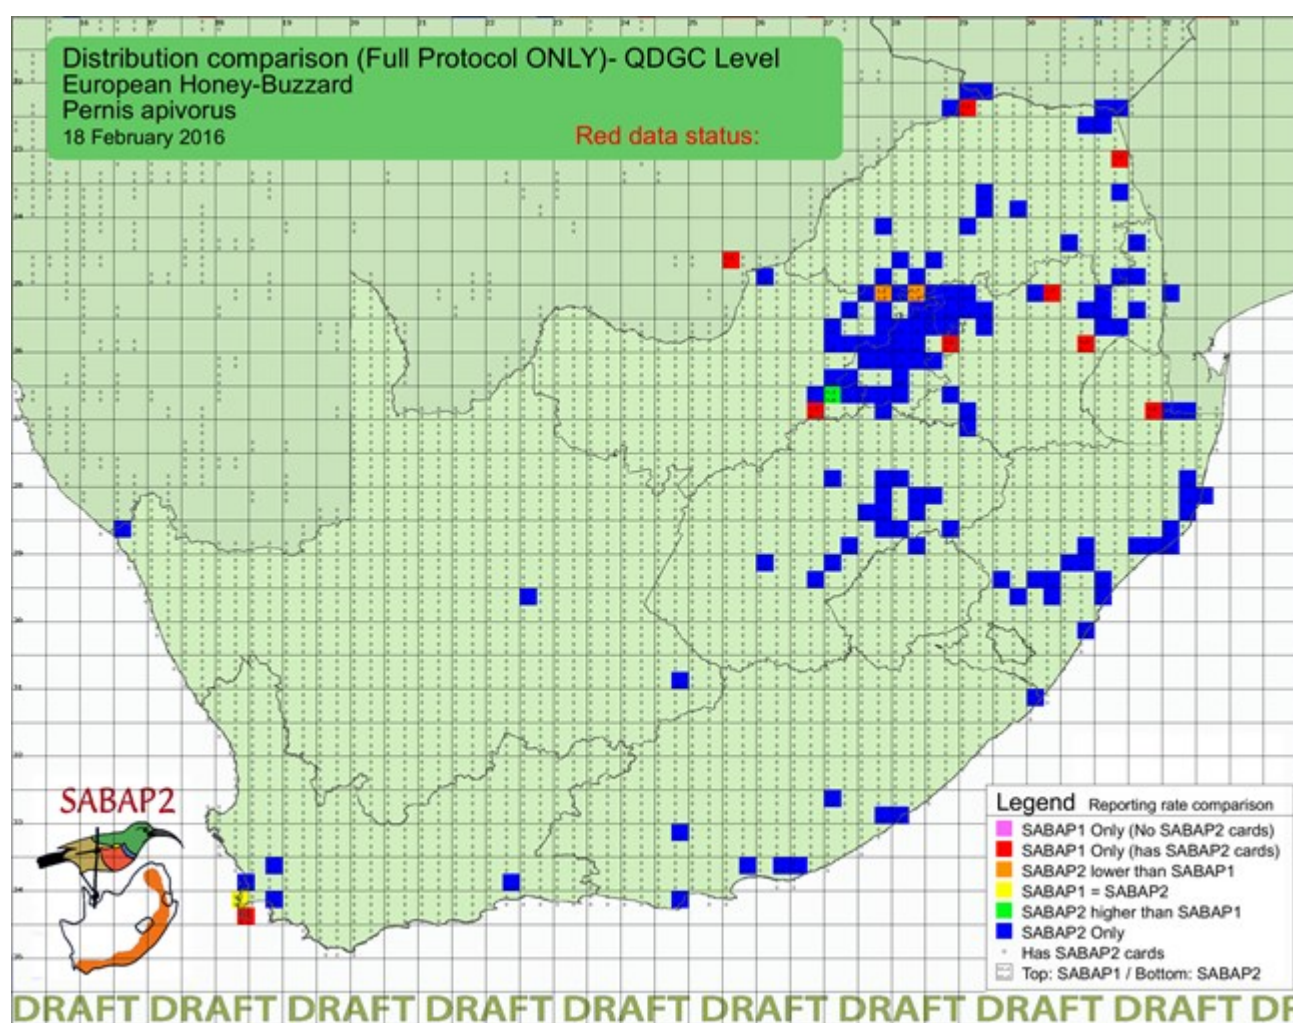

Figure 2. A comparison between the distribution of the European Honey Buzzard in South Africa between the first and second Southern African Bird Atlas Projects.

Acknowledgements

Thank you to all my birding colleagues, near and far, who kindly responded to my request for further information about this very vulnerable but endearing raptor. In particular I would like to mention Rob Bilijsma, Tracy Branfield, Bill Clark, Paul da Cruz, Derek Engelbrecht, Dick Forsman Gareth Hazell, Richard McKibbin, Niall Perrins Lance Robinson, Rob Simmons, Peter Steyn, Craig Symes, Les Underhill, Oscar van Eysen and Wouter Vansteelant. The following reported having observed European Honey Buzzards in Africa but had not heard them vocalizing: John Adamson, David Allan, Mark Anderson, Andre Botha, Mark Brown, Matthew Burnett, Callan Cohen, Alan Collett, Dawie de Swardt, Derek Engelbrecht, Albert Froneman, Doug Harebottle, Gareth Hazell, Alan Kemp, Geoff Lautenbach, Etienne Marais, Andre Marx, Margaret Mclvor, John Mendelsohn, Doug Newman, Faansie Peacock, Peter Steyn, Warwick Tarboton, Gareth Tate, Les Underhill, Herman van den Berg, Gerhard Verdoorn, Pieter Verster and Malcolm Wilson. David Allan, Niall Perrins and Dick Forsman helped with interpreting photographic evidence, and David Allan and Peter Ryan assisted turning anecdotal evidence into meaningful scientific data.

Afrotropical Bird Biology (ABB) is a free, open-access, online journal for articles that describe aspects of the natural and cultural history of birds in the Afrotropical region, including its offshore islands. These include, but are not restricted to, identification features, sounds, distribution and demography, movements, habitats, diseases and parasites, general habits, foraging and food, breeding, interactions with humans, human cultural beliefs and practices as they pertain to birds, moult and biometrics of birds. ABB publishes original contributions focused on presenting information about the natural history of Afrotropical birds. This includes short communications (<2 500 words, including references) and data papers. All contributions will be reviewed by at least one editor and external, independent referees may also be employed at the discretion of the editors.

All papers are published under the Attribution-NonCommercial CC BY-NC license, which lets others remix, adapt, and build upon your work non-commercially, and although their new works must also acknowledge you and be non-commercial, they don't have to license their derivative works on the same terms.
